ABSTRACT OF THE DISCLOSURE

A numerical control apparatus for machine tool, includes: an NC program storage portion for storing an NC program; a block skip command detection portion for detecting whether a block skip command for skipping execution of blocks after a position where the block skip command is described is present in the NC program stored in the NC program storage portion or not; a block skip end command detection portion for detecting whether a block skip end command provided in connection with the block skip command to permit execution of blocks after a position where the block skip end command is described is present in the NC program or not; and a coordinate comparison portion for performing comparison concerning a difference between coordinates on at least one control axis in the block skip command and the block skip end command.
